

DOT V25.4

New Features

This new release brings significant improvements in connectivity, performance and usability. Here are the highlights.

DOT Anonymizer

more connectivity,
more control

Newly supported connectors

DOT Anonymizer now includes native connectors for **Hadoop** and **Google Cloud Storage**, enabling you to anonymize and detect sensitive data directly within your Big Data and cloud environments.

SQL Server

Anonymizing Microsoft SQL Server tables containing billions of rows is now fully supported without any memory constraints – perfect for your most demanding production environments.

Production deployment

A new CLI command allows you to **import a project directly from the design server** to the production server in just a few steps, eliminating tedious manual operations.

Version management

Version management is **now available for all entities**, providing improved tracking and stronger governance over your anonymization projects.

Web interface

When creating a data source, you can **now see in real time which driver connectors are licensed for your product** – no more guesswork about what is available in your environment.

Data models

All virtual relations and foreign keys of a data source can **now be viewed in a single window**, giving you an immediate and clear understanding of your data models.

Execution reports

Extraction execution reports can **now be exported in JSON format**, making it easier to integrate them into your reporting and audit tools.

DOT Extract

more flexibility
in managing your data

Data sources

It is now possible to **duplicate a data source** (with or without user relations) and import user relations from a CSV file – a significant time-saver when setting up new environments.

Work in your own language

The web application **now automatically adapts to the user's browser language**, ensuring a more natural and comfortable experience for all your teams around the world.

Usability

- Date sorting in result views
- Password visibility toggle
- Fully clickable "Add" and "Refresh" links
- Streamlined filter creation process
